🎯 Real-life Project Feel

Project idea:

> **"College Fund Splitter"**
> Friends milke trip / party ke liye ETH collect karte hain, track karte hain, aur later withdraw.

🧠 BIG PICTURE (feel first)

Tumhara dApp = **Mall** 🏬
Blockchain = **Bank + Ledger** 🏦

Aur yeh 3 tools = **staff members**

```
User 👤
  ↓ clicks
reown 🧾 (gate + ID check)
  ↓ gives wallet access
wagmi 🧠 (manager)
  ↓ decides what to do
viem ⚙️ (engineer)
  ↓ talks to blockchain
Ethereum ⛓️
```

🧩 STEP-BY-STEP FEEL (user journey)

🟢 STEP 1: User opens website

User opens your site.

🧠 React app loads
Nothing Web3 yet.

🟣 STEP 2: User clicks “Connect Wallet”

🎭 **ENTER: reown**

👉 reown opens a **wallet modal**

- MetaMask
- WalletConnect
- Trust Wallet

🧠 reown ka kaam:

- Wallet dikhao
- User se permission lo
- UX smooth rakho

FEEL:

> “Gate pe security guard khada hai – bina ID ke andar nahi”

🟢 STEP 3: Wallet connected

reown says:

```
✔ wallet connected
✔ address mila
```

✔ `chain pata hai`

Now baton passes to 👉 **wagmi**

🔵 STEP 4: App ko user ka data chahiye

🎭 **ENTER: wagmi**

```
const { address, isConnected } = useAccount()
```

🧠 wagmi karta kya hai?

- Wallet state rakhta hai
- React ko auto re-render karata hai
- Cache karta hai data

FEEL:

"Manager notebook me likh raha hai:

- kaunsa user
- kaunsi chain
- kab connect hua"

🟡 STEP 5: Show contract data (Fund balance)

User dekhna chahta hai:

> “Total ETH collected?”

wagmi bolta hai:

> “viem bhai, zara blockchain se pooch ke lao”

🔴 STEP 6: Blockchain se baat

🎭 **ENTER: viem**

```
publicClient.readContract({
  address: contractAddress,
  abi,
  functionName: "totalBalance"
})
```

🧠 viem karta kya hai?

- ABI encode karta hai
- RPC call banata hai
- Blockchain se result laata hai

FEEL:

> “Engineer basement me jaa ke machine chala raha hai”

🟢 STEP 7: Data upar aata hai

`Ethereum → viem → wagmi → React UI`

User sees:

💰 Total Fund: **3.4 ETH**

🔥 **AUTO UPDATE** jab koi deposit kare
(React magic via wagmi)

🟠 STEP 8: User clicks “Contribute 0.1 ETH”

Now **WRITE transaction**

---

wagmi bolta hai:

```
useWriteContract()
```

But wagmi **khud sign nahi karta**

🟣 STEP 9: Wallet se SIGN

reown + wallet come back

Wallet popup:

“0.1 ETH send karna hai?”

User clicks **Confirm**

🧠 FEEL:

“User apna cheque sign kar raha hai”

🔴 STEP 10: Transaction send

viem:

- TX banata
- Gas estimate
- Blockchain ko bhejta

⛓️ Ethereum confirms

🟢 STEP 11: UI auto refresh

wagmi:

- TX mined detect karta
- Cache update karta
- UI refresh

User sees:

💰 Total Fund: **3.5 ETH**

🎉 DONE

🔁 WHY 3 LAYERS ARE NEEDED

❌ Without viem

- Blockchain se baat hi nahi ho sakti

❌ Without wagmi

- Har cheez manually manage
- React headache 💀

❌ **Without reown**

- Wallet UX painful
- Users bhaag jayenge
